

CLAIMS

I claim:

1. A lintel structure for masonry units over a wall opening consisting of a plurality of perforated suspension members that are attached to masonry units with a threaded anchor; said suspension member, in turn being fastened to a support beam that is contained completely within the wall cavity.
2. In combination according to claim 1, the improvement where a connection strut channel is continuously attached to the support beam, as a means of connecting the perforated suspension member that allows minute adjustment of the location of the suspension member along the axis of the support beam.
